RCII-7	Support for Implementation of Clean Combined Heat and Power	<i>Not Quantified</i>					Pending
RCII-8	Support for Renewable Energy Applications	<i>Not Quantified</i>					Pending
RCII-9	Carbon Tax	<i>Not Quantified</i>					Pending

Note: Italicized text reflects questions for or items still under consideration by the TWG as it continues its work on elaborating option descriptions.

RCII-1 Demand Side Management Programs, Efficiency Funds and Requirements

Policy Description

This policy option involves increasing the efficiency of electricity and natural gas use in Montana through Demand Side Management (DSM) programs, funds, and/or requirements. This option focuses on what are typically termed DSM activities – programs, usually delivered by utilities or government-designated agencies, designed to reduce energy consumption and/or change the timing of energy use. Examples of DSM programs include technical assistance for and implementation of energy efficiency and renewable energy measures, electrical (and in some cases fuel) demand response, alternative rate schedules, and research activities. Note that the activities described for this option may also support implementation of other options recommended by the CCAC, such as RCII-11 and RCII-12.

Policy Design

This policy design is focused on increasing energy efficiency programs through the State utilities, and is linked with the energy efficiency element of Energy Supply TWG option (ES-1), “Environmental Portfolio Standard (EPS).” ES-1 would require that each utility capture 100% of its cost-effective energy efficiency over a period of 15 years.

(Note: TWG members on the February 13th agreed that on the following text as an element of the Environmental Portfolio Standard (ES-1). Subsequently, the ES TWG suggested the timing of implementation of the option for electric cooperatives match that for investor-owned utilities. This modification has not yet been reviewed by the RCII TWG.)

Goals/Timing: The goals for this option follow the goals from the ES-1 option:

- “Energy conservation” below refers to electricity and natural gas.
- Require each investor-owned utility (IOU) in the State to:
 - By 2010, identify its achievable cost-effective energy conservation for the subsequent 10 years.
 - Implement a plan to achieve 100% of its cost-effective energy conservation by 2025.
 - Update its energy-efficiency assessment and plan regularly, possibly every two years.
- *The following element is being reviewed by the TWG members with close connections to Electric Co-operatives Require each co-operative utility in the State to:*
 - *By 2015, identify its achievable cost-effective energy conservation for the subsequent 10 years.*
 - *Implement a plan to achieve 100% of its cost-effective energy conservation by 2025.*
 - *Update its energy-efficiency assessment and plan regularly, possibly every two years.*

Parties Involved: Investor-owned utilities, electric cooperatives, Montana PSC, state government.

RCII-2 Market Transformation and Technology Development Programs

Policy Description

Market transformation is a relatively new term for energy efficiency programs that focus on voluntary efforts implemented by non-utility organizations to encourage greater uptake by consumers (residential, commercial, and industrial, as well as the professionals that service energy-using equipment) of cost-effective energy efficiency practices. Market transformation also seeks to ensure sufficient supplies of technologies and practitioners to meet the subsequent increased demand for energy efficiency. As such, a market transformation program is designed to create a situation where the bulk of the private market automatically adopts or incorporates technologies or techniques that result in improved energy efficiency. The goal of a market transformation and technology development program is to put energy efficiency technologies and practices into a position where they will be demanded by the public, chosen by builders and manufacturers, and provided by retailers and contractors. Methods of transformation can be different for each technology or technique, but often revolve around public and private review of quality and effectiveness, including partnerships between government agencies, retailers, manufacturers, and non-governmental agencies. Market transformation programs can be statewide or regional.

Policy Design

Market transformation is an important goal for Montana, and an important mechanism to cost-effectively bring energy-efficient products and services to consumers. It is recognized, however, that Montana constitutes a limited market, by itself, for energy-efficient products. As a result, Montana should focus its efforts on joining, supporting, or increasing its participation in regional market transformation alliances (the Northwest Energy Efficiency Alliance and the Midwest Energy Efficiency Alliance are examples) that develop and implement technologies for reduction of energy use and GHG emissions. This could include, as applicable, working to extend market transformation efforts currently focused on specific parts of the state to consumers statewide, as well as expanding the number and types of different energy-efficient products included in market transformation efforts in Montana.

Market transformation and technology development efforts should stress addressing technologies of particular significance to Montana. One example is the testing and monitoring of residential and commercial high-efficiency structures to determine their performance under Montana conditions and to identify barriers to implementation of energy-efficient building practices.

Goals: By 2009, put in place mechanisms to allow broaden coverage of market transformation programs in Montana both to additional geographic areas and with regard to technologies covered. *Is consideration of a specific energy savings target desirable?*

Timing: as above.

Parties Involved: Under Development.

Other: Under Development.

RCII-3 State Level Appliance Efficiency Standards and State Support for Improved Federal Standards

Policy Description

Appliance efficiency standards reduce the market cost of energy efficiency improvements by incorporating technological advances into base appliance models, thereby creating economies of scale. Appliance efficiency standards can be implemented at the state level for appliances not covered by federal standards, or where higher-than-federal standard efficiency requirements are appropriate.¹ Regional co-ordination for state appliance standards can be used to avoid concerns that retailers or manufacturers may (1) resist supplying equipment to one state that has advanced standards or (2) focus sales of lower efficiency models on a state with less stringent efficiency standards.

Policy Design

In recognition of the fact that Montana represents, on its own, a relatively limited market for appliances and equipment, this policy is designed to encourage the State to work with other States and with regional entities², as applicable, to:

- Review federal appliance standards, and work with federal agencies and others toward raising federal appliance and equipment energy efficiency standards where applicable.
- Implement, in concert with other states, higher-than-federal energy efficiency standards for appliances where technological advances allow. Analyses of possible energy efficiency standards that can be enacted at the State-level are available at www.standardsasap.org. Draft legislative language can be found at http://www.apolloalliance.org/strategy_center/model_legislation/eelegis.cfm.
- Develop and implement standards for residential-sector appliances not currently covered by federal standards.
- Develop and implement standards for commercial-sector appliances and equipment not currently covered by federal standards.

It is anticipated that the process of setting higher energy-efficiency standards in Montana, in concert with other States, will encourage higher Federal standards and higher-volume manufacturing of higher-efficiency appliances and equipment, resulting in wider distribution and likely lower prices for these devices.

Goals: Review of standards and report to Governor by 2008, with adoption of changes in standards by 2009 (activities designed to be timed to coordinate with consideration of energy matters by the Montana State Legislature).

¹ In recent years, Arizona, Oregon, and Washington, among other states, adopted state standards for several appliances; this led to the inclusion of standards for these appliances in the 2005 federal Energy bill.

² It was suggested that the TWG review any activities that the Northwest Energy Efficiency Alliance have underway with regard to improving energy efficiency standards.

Timing: as above.

Parties Involved:

- Electric and gas utilities.
- State government agencies, including the Department of Environmental Quality and the Department of Commerce.
- Appliance manufacturers and appliance/equipment industry representatives.

Other: Under Development.

RCII-4 Building Energy Codes

Policy Description

Building energy codes specify minimum energy efficiency requirements for new buildings or for existing buildings undergoing a major renovation. Given the long lifetime of most buildings, amending State and/or local building codes to include minimum energy efficiency requirements and periodically updating energy efficiency codes could provide long-term GHG savings. Implementation of building energy codes, particularly when much of the building occurs outside of urban centers, can require additional resources.

Policy Design

The proposed policy to improve energy-efficiency-related elements of building codes in Montana, so as to reduce the amount of fossil energy input needed to operate buildings in the State, includes the following elements:

- Undertake a comprehensive review of existing building codes in Montana to determine where increased energy efficiency can be achieved.
- Increase standards such that the minimum performance of new and substantially-renovated buildings, both commercial and residential, is at least 10% higher by 2012 than that required by today's building codes (IECC 2003, see below), and 20% higher by 2020.
- Work toward achieving “carbon-neutral” status for new buildings by 2030, with an interim target of a 50% reduction in fossil energy use, relative to current standards, by 2020. Reductions in greenhouse gas emissions related to building energy use can be achieved through a combination of increased energy efficiency, switching to low- and no-carbon fuels (including solar energy) for previously fossil-fueled end-uses, purchases of “green power” from off-site providers, and/or installing on-site power generation fueled by renewable energy sources.
- Encourage the use of recycled and local building materials.
- Express energy efficiency standards on a per-unit floorspace basis for commercial buildings, and on a per-dwelling-unit basis for residential buildings.
- Periodically and regularly (no less frequently than every 3 years) review building codes, including energy efficiency requirements of building codes, to assure that they stay up-to-date.³
- Offer, and require as appropriate, education to equip building code officials, builders, designers, and others to effectively implement building energy code improvements. This might include, for example, developing a corps of licensed independent contractors who

³ It is expected the role of State agencies in the code review process will largely be to set it in motion.

could serve to inspect buildings for compliance with the new energy codes, especially in rural areas that currently may have minimal code inspection.

Goals: see above.

Timing: see above.

Parties Involved:

- Building Codes Council (which includes representatives from the League of Cities and Towns as well as builders, engineers, local government officials, and representatives of State agencies).
- Citizens/consumer advocates (including expanding Council membership to include citizen representation).
- Department of Labor and Industry.
- Department of Environmental Quality.
- Electric utilities.

Other: Under Development.

RCII-5 “Beyond Code” Building Design Incentives and Mandatory Programs

Policy Description

This policy provides incentives and targets to induce the owners and developers of new and existing buildings to improve the efficiency with which energy and other resources are used in those buildings, along with provisions for raising targets periodically and resources to help achieve the desired building performance. Many “Green Building” programs have been developed that define standards for efficient energy and resource use and that encourage demand for these green buildings through recognition, incentives, and government mandates.⁴ This policy includes elements to encourage the improvement and review of energy use goals over time, and to encourage flexibility in contracting arrangements to encourage integrated energy- and resource-efficient design and construction.

Policy Design

A combination of financial and regulatory incentives would be used to provide incentives for owners and developers of new and existing buildings to improve their structures, or to build new structures, that exceed energy-efficiency (and net greenhouse-gas emissions) provisions of building codes in force.

Goals:

- Reduce per-unit-floor-area consumption of grid electricity and natural gas by 20% by 2020 in existing buildings, and by 50% in new buildings by 2020. Up to 10% of the targeted reduction for new homes can come from use of off-site electricity generation from renewable energy⁵. These requirements should be phased in over time, and will have the following targets:
- Improve X% of existing residential units in Montana by the year 2020.
- Improve X% of existing commercial floorspace in Montana by the year 2020.
- Provide incentives such that X% of new or substantially remodeled residential units in Montana exceed building energy and greenhouse gas emissions codes in force by the amounts above by the year 2020.
- Provide incentives such that X% of new or substantially remodeled commercial floorspace in Montana exceeds building energy and greenhouse gas emissions codes in force by the amounts above the year 2020.

Timing: See above.

⁴ Existing programs include EPA’s ENERGY STAR Homes and Leadership in Energy and Environmental Design (LEED).

⁵ Note that this limit on the use of renewable off-site electricity generation is assumed to count only the renewable fraction of electricity purchased that is beyond that included in any statewide renewable portfolio standard, but this restriction needs to be confirmed by the TWG and CCAC.

Parties Involved:

- State and local government permitting agencies.
- Utilities.
- Financial services industries.
- Building industries.

Other: Under Development.

RCII-6 Consumer Education Programs

Policy Description

The ultimate effectiveness of emissions reduction activities in many cases depends on providing information and education to consumers, as well as to future consumers (primary and secondary school students), regarding the energy and GHG emissions implications of consumer choices. Public education and outreach is vital to fostering a broad awareness of climate change issues and effects (including co-benefits, such as clean air and public health) among the state's citizens. Such awareness is necessary to engage citizens in actions to reduce GHG emissions. Public education and outreach efforts should integrate with and build upon existing outreach efforts involving climate change and related issues in the state. Ultimately, public education and outreach will be the foundation for the long-term success of all of the mitigation actions proposed by the CCAC, as well as those that may evolve in the future.

In addition, in order to effectively implement many of the other options in the residential, commercial, institutional, and industrial sectors, as well as in other sectors, specific and targeted education, outreach, and licensing requirements will be required for professionals in, for example, a variety of building-related and other trades in order to ensure that those professionals have the expertise to support aggressive GHG mitigation options in Montana.

Policy Design

Elements of the design for this policy will:

- Offer consumer education related to energy efficiency and the environmental consequences of energy and other choices.
- Work with the Office of Public instruction and others to develop and implement curricula for primary and (particularly) secondary schools that educate students so that they can evaluate the implications of consumption choices.
- Implement and enhance professional education and certification programs for teachers and for those involved in providing products and services related to energy use and greenhouse gas emissions, so as to build the statewide pool of individuals trained to support RCII and other policy options. This training for professionals (including architects, engineers, builders, code inspectors, lighting and HVAC⁶ equipment installers, and others) who advise the public on energy choices is seen as a crucial component to the success of other RCII initiatives.
- Provide education programs with a strong focus on energy savings in existing buildings that include follow-up surveys on the actions that have been implemented by participants.

⁶ Heating, Ventilation, and Air Conditioning.

- Education of consumers, and of those who advise them on energy choices, is seen as crucial to making sure that intelligent choices are made related to energy use.⁷

Goals: Under Development.

Timing: Synchronize education initiatives with development and implementation of other RCII options so that those who will make decisions related to energy efficiency and GHG emissions reduction, and those who will implement improvements, will have the background to do so effectively.

Parties Involved:

- Utilities.
- Government agencies (local, state, and federal).
- Private entities.
- Primary and secondary schools.
- Building trade organizations.

Other: Under Development.

⁷ Note that there is overlap between this RCII option and some of the elements of an option (CC-4) being elaborated by the Cross-Cutting TWG.

RCII-7 Support for Implementation of Clean Combined Heat and Power

Policy Description

Distributed generation with clean combined heat and power (CHP) systems reduces fossil fuel use and GHG emissions both through the improved efficiency of the CHP systems, relative to separate heat and power technologies, and by avoiding transmission and distribution losses associated with central power stations that are located far away from where the electricity is used. Implementation of these systems by residential, commercial, institutional and industrial energy consumers should be encouraged through a combination of regulatory changes and incentive programs.

Policy Design

The Energy Supply TWG is developing a similar option, information from that group will be provided to the RCII TWG. A review of existing studies on CHP potential in Montana is to be undertaken with help from TWG members.

Goals: Under Development.

Timing: Under Development.

Parties Involved: Under Development.

Other: Under Development.

RCII-8 Support for Renewable Energy Applications

Policy Description

Distributed electricity generation sited at residences and commercial and industrial facilities, and powered by renewable energy sources (typically solar but also wind and hydro), displaces fossil-fueled generation and avoids electricity transmission and distribution losses, thus reducing GHG emissions. This policy can also encourage consumers to switch from using fossil fuels to using renewable fuels in applications such as water, process, and space heating, as well as to supply new energy services using fuels that produce low or no GHG emissions. Increasing the use of renewable energy applications in homes, businesses, and institutions in Montana can be achieved through a combination of regulatory changes and incentives.

Policy Design

[NOTE THAT RELATED OPTIONS ARE BEING CONSIDERED BY THE ENERGY SUPPLY TWG (SEE ES-4)]

The design of this policy may include the following elements:

- Utility incentives for consumers to develop distributed generation, including net-metering policies.
- Removal of barriers to the implementation of distributed generation, including revising interconnection rules as appropriate.
- Tax or other incentives, or favorable tax treatment, for investments in distributed generation.

This policy encompasses solar (thermal and photovoltaic) systems and biomass fuels for use in homes and business.

Goals: *Goals for this option have not yet been set. Current penetration of solar photovoltaic systems in the NorthWestern Energy service territory in Montana suggest that about 0.1% or less of Montana homes currently use these systems. The penetration of solar thermal water heating systems is also quite limited. The RCII TWG is seeking other studies of distributed energy potential to help set program targets.*

Timing: Under Development.

Parties Involved: Under Development.

Other: Under Development.

RCII-9 Carbon Tax

(To be considered jointly with ES TWG)

Policy Description

A CO₂ tax would be a tax on each ton of CO₂ emitted from an emissions source covered by the tax. A CO₂ tax could be imposed upstream based on carbon content of fuels (e.g. fossil fuel suppliers) or at the point of combustion and emission (e.g. typically large point sources such as power plants or refineries). Taxed entities would pass some or all of the cost on to consumers, change production to lower emissions, or a combination of the two. As the suppliers respond to the tax, consumers would see the implicit cost of CO₂ emissions in products and services, and would adjust their behavior to purchase substitute goods and services that result in lower CO₂ emissions. CO₂ tax revenue could go completely to state revenue and be used in a variety of ways such as income tax reduction or policies and programs to assist with CO₂ reductions. CO₂ tax revenue can also be directed to helping the competitiveness of industries or assisting communities most affected by the tax.

Policy Design

The RCII TWG will coordinate with the Energy Supply TWG in considering and developing this option. The ES TWG has expressed the sense that a regional/national approach would be far preferable to Montana-alone tax (which should likely not be considered).

(At the request of the ES TWG, the CCS team is gathering additional information on the status of GHG emission taxes in US and Europe (levels, coverage, and achievements), and will provide this to the RCII TWG as well. The possibility of having a cross-group volunteer call to discuss carbon tax and cap-and-trade will be explored.)

Goals: Under Development.

Timing: Under Development.

Parties Involved: Under Development.

Other: Under Development.

RCII-10 Industrial Energy Audits and Recommended Measure Implementation

Policy Description

This policy option includes providing industrial-sector energy technical assistance (energy audits) to identify and recommend options for reducing fossil energy and electricity use, and for reducing non-energy emissions of GHGs. For example, an agency could be set up, or housed at an existing post-secondary institution, that hires experts who will visit industrial sites to assess current practices and equipment and provide recommendation for reducing GHG emissions. A combination of incentives, expertise, and information to implement recommended options are included in the policy to encourage the operators of industrial-sector facilities to follow up on audit recommendations.

Policy Design

(TWG members suggested further talks with industry representatives and others to develop goals for this option. Potential contacts include John Campbell, NorthWestern Energy, Don Quander (Large Customer Group), Holland and Hart, and Dave Ryan, CCAC member.)

Following the Feb 13th meeting, the CCS facilitators and TWG members will contact the above representatives and other industrial contacts to help investigate the most effective actions that the State could undertake to encourage energy and GHG emission reductions in the industrial sector. This information will be reported to the RCII TWG.

Goals: Under Development.

Timing: Under Development.

Parties involved: Under Development.

Other: None cited.

RCII-11 Low Income Energy Efficiency Programs

Policy Description

Energy efficiency programs are a key component of other RCII options, and energy efficiency programs typically yield significant economic benefits (as well as greenhouse gas emissions reductions) to consumers that participate. Low-income consumers, however, are frequently unable to participate in energy efficiency programs due to a lack of funds to pay for improvements or, in the case of renters, an inability to either make changes to their residences or fully benefit from any cost savings. In recognition of this barrier, this policy urges the implementation of programs specifically targeted to the needs of low-income residents for services such as weatherization, updating or repairing inefficient appliances, and funding for renewable energy systems. These programs could be designed so as to offer low-income residents energy efficiency services with a minimum of up-front costs, and should be marketed through an aggressive campaign of outreach to low-income households and communities. Programs designed to work with both landlords and tenants could also be considered.

Policy Design

(TWG members are contacting the following people currently involved in developing low-income programs to ask about realistic approaches, goals and timing for application of this option. Proposed contacts include Jim Morton, Human Resource Development Council District XI; Jackie Boyle, AARP Montana; Kathy Hadley, National Center for Appropriate Technology)

Goals: Under Development.

Timing: Under Development.

Parties involved: Under Development.

Other: None cited.

RCII-12 State Lead by Example

Policy Description

The Montana State Government can provide leadership in moving the State toward a stock of buildings with much higher energy efficiency, and toward improving efficiency in the operations of State buildings. The proposed policy provides energy efficiency targets that are much higher than code standards for new state-funded and other government buildings. The proposed policy also includes elements to encourage the improvement and review of efficiency goals over time and to encourage flexibility in contracting arrangements to encourage integrated energy-efficient design and construction. Targets are also provided for the upgrading of energy efficiency in existing state government facilities.

Policy Design

Key elements of this policy include:

- New state government buildings should be LEED-certified at the “silver” level⁸.
- State government purchasers should purchase ENERGY STAR-Certified appliances and equipment where available.

(The TWG has not yet considered whether the following elements should be included in the policy: In addition, “green power” use targets for new and existing state facilities are provided in this policy to help encourage the use of electricity generated from renewable resources like the sun, wind and organic matter. Also included in this option is a program for the bulk purchase of appliances and equipment with higher-than-standard energy efficiency by public agencies.)

The Cross-Cutting TWG suggested having the option include a requirement for carbon-neutral bonding. Climate neutral bonding means that there is no net increase in GHG emissions within the bond issuing agency’s geographical jurisdiction after the project becomes operational. A climate neutral performance standard will challenge architects and engineers to design buildings that minimize the amount of energy they use in the first place. High performance buildings meeting a climate neutral requirement and built to meet or exceed the state’s existing sustainable building guidelines will save taxpayers money over the long term as a result of their lower operating costs.

Funding should be provided to analyze and benchmark the energy performance of all existing State government buildings.

Goals: Reduce per-unit-floor-area consumption of grid electricity and natural gas by 20% by 2020 in existing buildings, and by 40% in new buildings by 2020. These requirements should be phased in over time.

Timing: See above. Begin implementing program by 2010, with full implementation as above.

⁸ “LEED” is Leadership in Energy and Environmental Design. See www.usgbc.org. Note also that an analysis by KEMA of DSM options for buildings in Montana is currently underway.

Parties Involved: State Agencies such as DEQ, building owners, developers, municipal governments, financial institutions (for climate-neutral bonding), building inspectors, architects, engineers, and air monitoring professionals.

Other: *The following design elements and goals have been suggested by the Cross Cutting TWG, but have not yet been considered in detail by the RCII TWG:*

- *Climate Neutral Bonding will require that any building projects financed with the issuance of state bonds result in no net increase in GHG emissions.*
- *If a new construction project is projected to result in an emissions increase, there must be GHG emissions offsets within the state or particular jurisdiction. Offsets could include on-site renewable energy development, renewable energy purchases, energy efficiency (in existing state buildings), carbon sequestration (tree planting), and switching to cleaner or renewable fuels. So, any GHGs emitted after the bond-financed project becomes operational will have to be offset.*
- *The new buildings could also offset their emissions by purchasing renewable electricity from their local utility. Paying a premium for what's known as "green pricing" electricity will usually be a more expensive offset option than energy efficiency.*
- *Buildings under this program should be designed in the most economically and energy-efficient manner.*
- *A community or state could install their own renewable energy project as a way to offset their GHG emissions.*
- *Monitor building emissions over time.*

RCII-13 Metering Technologies with Opportunity for Load Management and Choice

Policy Description

Providing energy consumers with price and other information via metering that allow consumers to more clearly identify the outcomes of their choices is a potentially useful tool in improving energy efficiency, reducing greenhouse gas emissions, and saving consumers money in Montana. This policy encourages the implementation of electricity metering technologies and tariff systems, including real-time energy pricing and rates that reflect the cost and greenhouse gas implications of the resources that must be used to provide power. This provides consumers incentives to manage their energy consumption so as to both reduce costs and GHG emissions.

Policy Design

Building on experience in Europe⁹ and elsewhere,¹⁰ Montana utilities would implement a system of metering of electricity demand and consumption that: (a) allows a consumer to purchase electricity from specific types of generating resources (b) allows the distribution utility and electricity generators to provide information on the cost and source of the electricity that the consumer is using at any given time. This system allows for interaction on a time-sensitive basis between the consumer, the utility, and the generating source. Through utility reports, the state can review the choices made by the consumers, and target state incentives and rules/tax structures so as to move electricity consumption/production toward choices that produce lower GHG emissions. *(The text above was added after the most recent TWG meeting, and has not yet been reviewed).*

This option could accommodate different types of electricity tariff structures, including time of use rates (which typically have impacts on the overall cost of generation, but modest if any impacts on GHG emissions) and increasing-cost block rate structures (in which tier rate structures charge more per unit used as consumers use more electricity per month), which can encourage electricity conservation. The metering system can also be used by the customer to place restrictions on the timing and amount of energy use, including to restrict overall demand.

Goals: Under Development.

Timing: Under Development.

Parties Involved: Utilities, electricity generators, electricity consumers, state regulatory agencies.

Other: Under Development.

⁹ For example, see the ENEL Contatore Elettronico program offered in Italy.

¹⁰ References to be provided.
